#### Project Title

Time-modulated phononic crystals

#### Project Description

This project focuses on the modeling of time-modulated phononic crystals, made of vibrating or rotating rods with elliptic cross-sections. Keeping in mind upcoming experimental realizations, it aims at developing innovative theoretical and numerical tools to describe the unusual wave phenomena due to the time modulation. Additionally to band-gaps due to the space periodicity, we expect to exhibit strong effects such as harmonic generation and reciprocity breaking.

#### Keywords

acoustic waves, metamaterials, theoretical and numerical modeling

#### Description of the Host Research Lab

The Institut Jean Le Rond d'Alembert (d'Alembert) is a research laboratory dedicated to expanding the field of knowledge in all areas of Mechanics, Acoustics and Energy.
