Project Title

Marine microbial communities in a melting Arctic Ocean

Project Description

The Arctic is rapidly changing due to increased warmth. Freshwater volume are surging, driven by river inflow, precipitation, and melting ice. Summer sea ice extent and thickness have dramatically decreased. These changes impact marine biodiversity and biogeochemical cycles. The project aims to study the Lincoln Sea, a critical Arctic region, to understand climate-induced changes in marine microbial communities and their effects on ecosystem functioning before irreversible alterations occur.

Keywords

microbiology, ecology, metagenomics

Description of the Host Research Lab

The LECOB is a multidisciplinary group that aims to deepen our understanding the dynamics of benthic environments, in order to contribute to the creation of a solid scientific basis for future marine spatial planning (EU 2014).
